AMENDMENTS TO THE CLAIMS

1. (Currently Amended) An image output apparatus comprising:

an image output section that outputs an image in accordance with received image data, the image output section having a plurality of output modes mutually different from one another in output quality; and

a correcting section that performs transferring~~transfers~~ image data to the image output section upon application of processing of detection and correction of a ~~predetermined inconvenience as to eyes~~red eye condition in the image represented by the image data to the image data, ~~or transfers~~and transferring image data to the image output section without application of processing of detection and correction of the predetermined inconvenience to the image data, ~~in accordance with a situation as to~~based on a comparison between the received image data and the image to be output according to output quality related with a selected output mode ~~whether an associated output mode of the image output section is a predetermined output mode which is relatively high in the output quality among the plurality of output modes~~.

2. (Original) An image output apparatus according to claim 1, wherein the output quality is a number of pixels constituting an image.

3. (Original) An image output apparatus according to claim 1, wherein the output quality is a display time for an image.

4. (Original) An image output apparatus according to claim 1, wherein the correcting section applies, as the processing, a red eye correcting processing in which red eyes in the image are detected and corrected.

5. (Currently Amended) An image output program storage medium storing an image output program, the image output program comprising:

an image output section that outputs an image in accordance with received image data, the image output section having a plurality of output modes mutually different from one another in output quality; and

a correcting section that performs transferring~~transfers~~ image data to the image output section upon application of processing of detection and correction of a ~~predetermined inconvenience as to eyes~~red eye condition in the image represented by the image data to the image data, ~~or transfers~~and transferring image data to the image output section without application of processing of detection and correction of the predetermined inconvenience to the image data, ~~in accordance with a situation as to~~based on a comparison between the received image data and the image to be output according to output quality related with a selected output mode ~~whether an associated output mode of the image output section is a predetermined output mode which is relatively high in the output quality among the plurality of output modes~~.

6. (Currently Amended) A server apparatus that transmits received image data to a client apparatus that outputs an image in accordance with the received image data, the server apparatus comprising:

an image correcting section that detects and corrects a ~~predetermined inconvenience as to eyes~~ red eye condition in the image represented by the image data;

an output quality obtaining section that obtains output quality of an image of the client apparatus; and

an image data transmission section that transfers image data corrected in the inconvenience in the image correcting section to the client apparatus, or transfers image data not corrected in the inconvenience to the client apparatus, in accordance with a situation as to whether the output quality obtained in the output quality obtaining section is higher than a predetermined quality.

7. (Original) An image output system comprising a plurality of client apparatuses each outputting an image in accordance with received image data, and a server apparatus that transmits image data to the client apparatuses,

wherein the plurality of client apparatuses include a plurality of types of client apparatuses that output images having output qualities mutually different from one another, and

wherein the server apparatus comprises:

an image correcting section that detects and corrects a predetermined inconvenience as to eyes in the image represented by the image data;

an output quality obtaining section that obtains output quality of an image of the client apparatus; and

an image data transmission section that transfers image data corrected in the inconvenience in the image correcting section to the client apparatus, or transfers image data not corrected in the inconvenience to the client apparatus, in accordance with a situation as to whether the output quality obtained in the output quality obtaining section is higher than a predetermined quality.
